Battery Storage Solutions

Home battery systems store excess solar energy generated during the day for use at night or during grid outages. A typical lithium-ion home battery has a capacity of around 10 to 13 kWh. When combined with a Time-of-Use tariff, batteries can be charged from the grid during off-peak hours and discharged during peak hours to avoid high costs, a practice known as peak shaving. Batteries also provide energy independence and security during extreme weather events.

Solar Integration Strategy:

When combined with solar panels, battery storage becomes incredibly powerful. During the day, your solar panels often produce more energy than your home consumes. Instead of sending this surplus back to the grid at a low feed-in tariff, a battery system captures it. You can then discharge this stored solar energy at night, effectively running your home on 100% renewable solar energy 24/7 and maximizing your return on investment.
